

ABSTRACT

An electrical tell tale system comprises a main control unit forming part of a trailer connector. The main control unit is a moulded module or cut printed circuit board, which fits into the connector. The main control unit has aligned pin connections to connect to and monitor all of the existing connections in the connector. The main control unit module includes screw type connections for the wiring from the vehicle harness and a tell tale monitor. The main control unit module is housed in the connector and by its connections changes the normal operation of the trailer connector to monitor all of its housed circuit connection in one complete unit.
